Virender Singh Negi                    SEC - B                    Roll -> 57

① Devops is a set of practices which combines software development team and operational team and information technology (ops) which aims to shorten the system's software development life cycle and provides continuous delivery with higher software quality

Devops:

→ shorten development cycle
→ reduces deployment failures and rollbacks.
→ improves collaboration communication.
→ increases efficiency
→ reduces cost and head head count.

② Puppet : is a tool that helps you manage and automate configuration of services

   Ansible : It aims to provide large productivity gains to a wide variety of automation challenges

   Docker : is designed for developers and system administrators an essential part of Devops.. with docker developers can focus on application development rather than being worried about the platform where it will run
